To whom it may concern:

I was recently contacted by Daniel Schmitt of Optimags to describe our success in operation of our MBCD 1.3-4.1 coater for transdermal patch production. We received the equipment in August 2016 and within one week had successfully set-up and completed our site acceptance test by producing 1,000 m of coated laminate in three days. Since then we have launched our cannabis-infused transdermal patches in the state of Arizona and due to its ease of transport mobility we will be repurposing this equipment in Florida, where patch market demand will be higher.

The equipment itself is very easy to operate and has a small footprint in comparison to other models, but does not sacrifice coating capacity. Once coating has stabilized the process is automated, and adjustments can be made quickly and easily to optimize the coating process. In addition, the equipment is versatile and Optimags worked diligently to ensure that the equipment met our needs and parameters.

Overall, we are very pleased with the MBCD 1.3-4.1 coater and the professionalism and graciousness of the Optimags team. Please feel free to contact me if you have any further questions.

Best Regards,

*Chris Witowski*
